( Physics )

**2013-2014 (PREVIOUS)-I/II SEMESTER**

**2014-2015 (FINAL)- III/IV SEMESTER**

Prepared by

32  
16/9

2014.

to 52.6%, (v) CGPA of 2.17 is equivalent to 41.04%, and (vi) CGPA of 1.11 is equivalent to 29.88%

## 2. Eligibility:

A candidate who has secured more than 50% or CGPA of 3.0 in the UGC Seven Point scale [ 45% or CGPA 2.5 in the UGC Seven Point Scale for SC/ST/Non-creamy layer OBC] or equivalent in the Bachelor degree in Science or Engineering or Technology or Medicine or Pharmaceutical Science shall be eligible for admission to First Semester of a Master of Science course.

same as

by Adm.  
Committee  
→

## 3. Scheme of Examination:

- (1) Each theory paper EoSE shall carry 100 marks The EoSE will be of 3 hours duration. Part 'A' of theory paper shall contain 10 Short Answer Questions of 20 marks, based on knowledge, understanding and applications of the topics/texts covered in the syllabus. Each question will carry two mark for correct answer.
- (2) Part "B" of paper will consisting of Four questions with internal choice (except in cases where a different scheme is specifically specified in the syllabus) of 20 mark each. The limit of answer will be five pages.
- (3) Each Laboratory EoSE will be of four/six hour durations and involve laboratory experiments/exercises. and viva-voce examination with weightage in ratio of 75:25

## 4. Course Structure:

The details of the courses with code, title and the credits assign are as given below.

### Abbreviations Used

#### Course Category

CCC: Compulsory Core Course

ECC: Elective Core Course

OEC: Open Elective Course

SC: Supportive Course

SSC: Self Study Core Course

SEM: Seminar

PRJ: Project Work

RP: Research Publication

#### Contact Hours

L: Lecture

T: Tutorial

P: Practical or Other

S: Self Study

#### Relative Weights

IA: Internal Assessment (Attendance/Classroom Participation/Quiz/Home Assignment etc.)

ST: Sessional Test

EoSE: End of Semester Examination

The medium of instruction and examination shall be English only.

→

## First Semester

S. No.	Subject Code	Course Title	Course Category	Credit	Contact Hours Per week			EoSE Duration (Hrs.)	
					L	T	P	Thy	P
1.	PHY 101	Classical Mechanics	CCC	5	4	1	0	3	0
2.	PHY 102	Quantum Mechanics	CCC	5	4	1	0	3	0
3.	PHY 103	Classical Electrodynamics-I	CCC	5	4	1	0	3	0
4.	PHY 104	Mathematical Methods in Physics	CCC	5	4	1	0	3	0
5.	PHY 105	Programming in C	CCC	4	4	0	0	3	0
7.	PHY 101	Seminar-1	SEM	2	0	0	3	0	1
8.	PHY 111	Electronics Lab/ General Lab/ Spectroscopy Lab (Eight Experiments)	CCC	8	0	0	12	0	6
9	PHY 112	Computational Programming in C	Physics CCC	4	0	0	6	0	4

## Second Semester

S. No.	Subject Code	Course Title	Course Category	Credit	Contact Hours Per week			EoSE Duration (Hrs.)	
					L	T	P	Thy	P
1.	PHY 201	Electronics	CCC	5	4	1	0	3	0
2.	PHY 202	Atomic and Molecular Physics	CCC	5	4	1	0	3	0
3.	PHY 203	Classical Electrodynamics-II	CCC	5	4	1	0	3	0
4.	PHY 204	Numerical Methods	CCC	5	4	1	0	3	0
5.		Core Elective	ECC	6	4	2	0	3	0

6.	PHY 211	Electronics Lab/ General Lab/ Spectroscopy Lab (Eight Experiments)	CCC	8	0	0	12	0	6
7	PHY 212	Numerical Methods Implementations using C Lab	CCC	4	0	0	6	0	4
8	PHY 221	Summer Training Programme (Min. 4 weeks after II Semester EoSE)	PRJ	4	0	0	24	0	0

### Third Semester

S. No.	Subject Code	Course Title	Course Category	Credit	Contact Hours Per week			EoSE Duration (Hrs.)	
					L	T	P	Thy	P
1.	PHY 301	Advance Quantum Mechanics	CCC	5	4	1	0	3	0
2.	PHY 302	Statistical and Solid State Physics	CCC	5	4	1	0	3	0
3.	PHY 303	Nuclear Physics -I	CCC	5	4	1	0	3	0
4.		Core Elective	ECC	6	4	2	0	3	0
5.		Core Elective	ECC	6	4	2	0	3	0
6.	PHY 306	Seminar -2	SEM	2	0	0	3	0	1
7.	PHY 311	Advance Physics Lab (Eight Experiments)	CCC	8	0	0	12	0	6
8.	PHY 312 Or PHY 321	Elective Laboratory Work/Project Work	ECC/ PRJ	4	0	0	9	0	6

## Fourth Semester

S. No.	Subject Code	Course Title	Course Category	Credit	Contact Hours Per week			EoSE Duration (Hrs.)	
					L	T	P	Thy	P
1.	PHY 401	Introduction to Quantum Field Theory	CCC	5	4	1	0	3	0
2.	PHY 402	Solid State Physics	CCC	5	4	1	0	3	0
3.	PHY 403	Nuclear Physics -II	CCC	5	4	1	0	3	0
4.		Core Elective	ECC	6	4	2	0	3	0
5.		Core Elective	ECC	6	4	2	0	3	0
6.	PHY 411	Advance Physics Lab (Eight Experiments)	CCC	8	0	0	12	0	6
7.	PHY 412 Or PHY 421	Elective Laboratory Work/Project Work	ECC/ PRJ	4	0	0	9	0	6/1
8.	PHY 431	Research Publication In Journals	RPJ	2	0	0	3	0	1
				41					

## Fourth Semester (Alternative)

S. No.	Subject Code	Course Title	Course Category	Credit	Contact Hours Per week			EoSE Duration (Hrs.)	
					L	T	S	Thy	P
1.	PHY 401	Introduction to Quantum Field Theory	SSC	5	0	0	10	3	0
2.	PHY 402	Solid State Physics-2	SSC	5	0	0	10	3	0
3.	PHY 403	Nuclear Physics -2	SSC	5	0	0	10	3	0
4.		Core Elective	SSC	6	0	0	12	3	0

23

5.		Core Elective	SSC	6	0	0	12	3	0
6.	PHY 422	Project Work in Industry Or Institution or University (16 week)	PRJ	12	0	0	24	0	1
9	PHY 431	Research Publication In Journals	RPJ	2	0	0	3	0	1
				41					

**Elective Core Courses:**

**Specialization Clusters**

- A. AC: Astrophysics and Cosmology
- B. CMP: Condensed Matter Physics
- C. HEP: High Energy Physics
- D. EC: Electronic Communications
- E. ES: Energy Studies
- F. PP: Plasma Physics
- G. ON: Advance Physics Open Electives

Elective Course Code	Specialization	Paper Title	Prerequisite
PHY A01	AC	Astrophysics -I	
PHY A02	AC	Astrophysics -II	
PHY A03	AC	General Theory of Relativity	
PHY A04	AC	Cosmology	
PHY A05	AC	Quantum Gravity and Quantum Cosmology	PHY A04 OR PHY A03
PHY	AC	Precision Tests in Astrophysics and Cosmology	PHY A01 or PHY

23

A06			A02 or PHY A04
PHY B01	CMP	Condensed Matter Physics -I	
PHY B02	CMP	Condensed Matter Physics -II	
PHY C01	HEP	High Energy Physics -I	
PHY C02	HEP	High Energy Physics -II	
PHY C03	HEP	High Energy Physics -III	
PHY C04	HEP	Renormalization	PHY C02
PHY C05	HEP	Supersymmetry	PHY C02
PHY C06	HEP	Physics Beyond Standard Model	PHY C02
PHY D01	EC	Electronics and Communications -I	
PHY D02	EC	Electronics and Communications -II	
PHY D03	EC	Microwave Electronics	
PHY D04	EC	Satellite Communication and Remote Sensing	
PHY E01	ES	Energy Studies -I	
PHY E02	ES	Energy Studies -II	
PHY F01	PP	Plasma Physics -I	
PHY F02	PP	Plasma Physics -II	
PHY Z01	ON	Laser and Laser Applications	
PHY Z02	ON	Reactor Physics -I	
PHY Z03	ON	Reactor Physics -II	
PHY Z04	ON	Health Physics -I	
PHY	ON	Health Physics -II	

Z05			
PHY Z06	ON	Computational Physics -I	
PHY Z07	ON	Computational Physics -II	
PHY Z08	ON	Laser -I	
PHY Z09	ON	Laser -II	
PHY Z10	ON	Thermal Physics-I	
PHY Z11	ON	Thermal Physics-II	

Elective Core Courses Lab. Work will be based on Lab. Work of above papers wherever applicable.

The medium of instruction and examination shall be English only.

## 5. Course Details

### PHY 101: CLASSICAL MECHANICS

1. Constraints, holonomic and non-holonomic constraints, D'Alembert's Principle and Lagrange's Equation, velocity dependent potentials, simple applications of Lagrangian formulation. Hamilton Principle, Calculus of Variations, Derivation of Lagrange's equation from Hamilton's principle. Extension of Hamilton's Principle for non-conservative and non-holonomic systems, Method of Lagrange's multipliers, Conservation theorems and Symmetry Properties, Noether's theorem. Conservation of energy, linear momentum and angular momentum as a consequence of homogeneity of time and space and isotropy of space.
2. Generalized momentum, Legendre transformation and the Hamilton's Equations of Motion, simple applications of Hamiltonian formulation, cyclic coordinates, Routh's procedure, Hamiltonian Formulation of Relativistic Mechanics, Derivation of Hamilton's canonical Equation from Hamilton's variational principle. The principle of least action.
3. Canonical transformation, integral invariant of Poincaré: Lagrange's and Poisson brackets as canonical invariants, equation of motion in Poisson bracket formulation. Infinitesimal contact transformation and generators of symmetry, Liouville's theorem, Hamilton-Jacobi equation and its application.
4. Action angle variable adiabatic invariance of action variable: The Kepler problem in action angle variables, theory of small oscillation in Lagrangian formulation, normal coordinates and its applications. Orthogonal transformation, Euler's theorem, Eigenvalues of the inertia tensor, Euler equations, force free motion of a rigid body.

23

**Reference Books:**

- (1) Goldstein - Classical Mechanics
- (2) Landau and Lifshitz - Classical Mechanics
- (3) A. Raychoudhary - Classical Mechanics

**PHY 102: QUANTUM MECHANICS**

1. (a) States, Amplitude and Operators: States of a quantum mechanical system, representation of quantum-mechanical states, properties of quantum mechanical amplitude, operators and change of a state, a complete set of basis states, products of linear operators, language of quantum mechanics, postulates, essential definitions and commutation relations.  
 (b) Observables and Description of Quantum system: Process of measurement, expectation values, time dependence of quantum mechanical amplitude, observable with no classical analogue, spin dependence of quantum mechanical amplitude on position, the wave function, super position of amplitudes, identical particles.
2. Hamiltonian matrix and the time evolution of Quantum mechanical States: Permittivity of the Hamiltonian matrix, time independent perturbation of an arbitrary system, simple matrix examples of time independent perturbation, energy given states of a two state system, diagonalizing of energy matrix, time independent perturbation of two state system the perturbative solution: Weak field and Strong field cases, general description of two state system, Pauli matrices, Ammonia molecule as an example of two state system.
3. Transition between stationary States: Transitions in a two state system, time dependent perturbations - The Golden Rule, Phase space, emission and absorption of radiation, induced dipole transition and spontaneous emission of radiation energy width of a quasi stationary state.  
 The co-ordinate Representation: Compatible observables, quantum conditions and uncertainty relation, Coordinate representation of operators, position, momentum and angular momentum, time dependence of expectation values, The Ehrenfest Theorem, the time evolution of wave function, the schroodinger equation, energy quantization, periodic potential as an example.
4. Symmetries and Angular Momentum:
  1. Compatible observables and constants of motion, symmetry transformation and conservation laws, invariance under space and time translations and space rotation and conservation of momentum, energy and angular momentum.
  2. Angular momentum operators and their Eigenvalues, matrix representations of the angular momentum operators and their eigenstates, coordinate representations of the orbital angular momentum operators and their eigenstate (Spherical Harmonics), composition of angular momenta, Clebsch-Gordon Coefficients tensor operators and Wigner Expant theorem, c commutation relations, of  $J_x, J_y, J_z$  with reduced tensor operator, matrix elements of vector operators, time reversal invariance and vanishing of static

electric dipole moment of stationary state.

### Reference Books:

1. Ashok Das and A.C. Melissions: Quantum Mechanics - A modern approach (Gordon and Breach Science Publishers).
2. P.A.M. Dirac, Quantum Mechanics.
3. E. Merzbecher: Quantum Mechanics, Second Edition (John Wiley and sons)
4. L.P. Landau and E.M. Lifshitz, Quantum Mechanics - Relativistic theory (Pergamon Press)
5. A. Ghatak and S. Lokanathan: Quantum Mechanics - Theory and Applications, Third Edition (Mac. Millan, India Ltd.

### PHY 103: CLASSICAL ELECTRODYNAMICS

1. Electrostatics: Electric field, Gauss Law, Differential form of Gaussian law. Another equation of electrostatics and the scalar potential, surface distribution of charges and dipoles and discontinuities in the electric field and potential, Poisson and Laplace equations, Green's Theorem, Uniqueness of the solution with the Dirichlet or Neumann boundary Conditions, Formal Solutions of electrostatic Boundary value problem with Green's function, Electrostatic potential energy and energy density, capacitance.

Boundary Value Problems in Electrostatics: Methods of Images, Point charge in the presence of a grounded conducting sphere, point charge in the presence of a charged insulated conducting sphere, point charge near a conducting sphere at a fixed potential, conducting sphere in a uniform electric field by method of images, Green function for the sphere, General solution for the potential, conducting sphere with hemispheres at a different potentials, orthogonal functions and expansion.

2. Multipoles, electrostatics of Macroscopic Media Dielectric: Multipole expansion, multipole expansion of the energy of a charge distribution in an external field, Elementary treatment of electrostatics with permeable media. Boundary value problems with dielectrics. Molar polarizability and electric susceptibility. Models for molecular polarizability, electrostatic energy in dielectric media.
3. Magnetostatics: Introduction and definition, Biot and Savart Law, the differential equations of magnetostatics and Ampere's law, Vector potential and magnetic induction for a current loop, Magnetic fields of a localized current distribution, Magnetic moment, Force and torque on and energy of a localized current distribution in an external induction, Macroscopic equations, Boundary conditions on B and H Methods of solving Boundary value Problems in magnetostatics, Uniformly magnetized sphere, magnetized sphere in an external fields, permanent magnets, magnetic shielding, spherical shell of permeable material in an uniform field.
4. Time varying fields, Maxwell's equations conservation laws: Energy in a magnetic field, vector and scalar potentials, Gauge transformations, Lorentz gauge, coulomb gauge, Green function for the wave equation, Derivation of the equations of

Macroscopic Electromagnetism, Poynting's Theorem and conservation of energy and momentum for a system of charged particles and EM fields. Conservation laws for macroscopic media. Electromagnetic field tensor, transformation of four potentials and four currents, tensor dissipation of Maxwell's equations.

**Reference Books:**

1. J.D. Jackson: Classical Electrodynamics
2. Panofsky & Phillip: Classical electrodynamics and magnetism
3. Griffith: Introduction to Electrodynamics
4. Landau & Lifshitz: Classical Theory of Electrodynamics
5. Landau & Lifshitz: Electrodynamics of continuous media

**PHY 104: MATHEMATICAL METHOD IN PHYSICS**

- a. Coordinates Transformation in  $N$  - dimensional space: Contravariant and covariant tensor, Jacobian. Relative tensor, pseudo tensors (Example: charge density, angular momentum) Algebra of tensors, Metric tensor, Associated tensors, Riemann space (Example: Euclidean space and 4D Minkowski space), Christoffel symbols, transformation of Christoffel symbols, covariant differentiation. Ricci's theorem. divergence, Curl and Laplacian tensor form, Stress and strain tensors, Hook's law in tensor form. Lorentz covariance of Maxwell equation, Klein Gordon and Dirac Equation, Test of covariance of Schrödinger equation.
- b. Group of Transformation: (Example: Symmetry transformation of square) Generators of a finite group, Normal subgroup, Direct product of groups, Isomorphism and Homomorphism. Representation theorem of finite groups, Invariants subspace and reducible representations, irreducible representation, crystallographic point groups, Irreducible representation of  $C_{4v}$ . Translation group and the reciprocal lattice.
- c. Fourier Transforms: Development of the Fourier integral from the Fourier Series, Fourier and inverse Fourier transform: Simple Applications: Finite wave train, Wave train with Gaussian amplitude, Fourier transform of derivatives, solution of wave equation as an application. Convolution theorem. Intensity in terms of spectral density for quasi monochromic EM Waves, Momentum representation, Application of Fourier transform to diffraction theory: diffraction pattern of one and two slits.
- d. Laplace transforms and their properties, Laplace transform of derivatives and integrals, derivatives and integral of Laplace transform. Convolution theorem. Impulsive function, Application of Laplace transform in solving linear, differential equations with constant coefficient with variable coefficient and linear partial differential equation.

**Reference books:**

1. Mathematical Methods for Physicists: George Arfken (Academic Press)
2. Applied Mathematics for Engineers and Physicists: L. A. Pipe (McGraw Hill)
3. Mathematical Methods - Potter and Goldberg (Prentice Hall of India)
4. Elements of Group Theory for Physicists: A.W. Joshi (Wiley Eastern Ltd.)

23

## 5. Vector Analysis (Schaum Series) (McGraw Hill)

**PHY 105: Computer Programming**

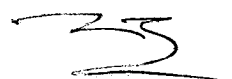

- Basic concepts of programming languages: Programming domains, language evaluation criterion and language categories. Describing Syntax and Semantics, formal methods of describing syntax, recursive descent parsing, attribute grammars, dynamic semantics. Names, Variables, Binding, Type checking, Scope and lifetime.
- Data types, array types, record types, union types, set types and pointer types, arithmetic expressions, type conversions, relational and Boolean expressions, assignment statements, mixed mode assignment, Statement level control structures, compound statements, selection statement, iterative statements, unconditional branching, guarded commands. fundamentals of sub-program, design issues, parameter passing methods, overloaded subprograms, generic subprograms, separate and independent compilation, design issues for functions, accessing nonlocal environment, user defined overloaded operators, implementing subprograms, blocks, implementing dynamic scoping.
- **Programming in C:** Character set, variables and constants, keywords, Instructions, assignment statements, arithmetic expression, comment statements, simple input and output, Boolean expressions, Relational operators, logical operators, control structures, decision control structure, loop control structure, case control structure, functions, subroutines, scope and lifetime of identifiers, parameter passing mechanism,
- Arrays and strings, structures, array of structures, Unions of structures, operations on bits, usage of enumerated data types. Bit-fields, Pointers to Function, Function returning Pointers.

*Recommended reference books:*

1. Robert W. Sebesta: Concepts of Programming Language, Addison Wesley, Pearson Education Asia, 1999.
2. Deitel and Deitel: How to Program C, Addison Wesley, Pearson Education Asia, 1999.
3. Bryon Gottfried, Programming with C, McGraw Hill International.

**PHY 111 / PHY 211 Electronics Lab/ General Lab/ Spectroscopy Lab Experiments**

1. To design a single stage amplifier of a given voltage gain and lower cut of frequencies.
2. To determine Lo. Co. and Rf of a given coil and to study the variations of Rf with frequency.
3. To design a RC coupled two stage amplifier of a given gain and the cutoff frequencies.

4. To study Hartley oscillator.
5. To Study Transistor bias Stability.
6. To design a Multivibrator of given frequency and study its wave shape.
7. To study the characteristics of FET and use it to design an relaxation oscillator and measure its frequency.
8. To study the characteristics of an operational amplifier.
9. To study the characteristics of a UJT and use it to design a relaxation oscillator and measure its frequency.
10. To study the addition, integration and differentiation properties of an operational amplifier.
11. Determine Planck constant using solar Cell.
12. To determine Planck constant and work function by a photo-cell.
13. To study regulated power supply using (A) Zener diode only (b) Zener diode with a series transistor (c) Zener diode with a shunt transistor.
14. To verify Fresnel's formula;
15. To study the percentage regulation and variation of Ripple factor, with load for a full wave rectifier.
16. To study analog to digital and digital to analog conversion.
17. To study a driven mechanical oscillator.
18. To verify Hartmann's formula using constant deviation spectrograph.
19. To find  $e/m$  of electron using Zeeman effect.
20. To find Dissociation energy to I.
21. Study of CH Bands.
22. Salt Analysis / Raman effect (Atomic).
23. Design and study of pass filters.
24. Michelson Interferometer.
25. Fabry parot Interferometer.
26. Determination of velocity of Ultrasonic waves.
27. Study of Elliptically polarised light by Babinet Compensator.
28. Verification of Cauchy's Dispersion relation.
29. Study of DC gate control characteristics and Anode current characteristics of SCR.

### PHY 112: Computational Physics Programming in C

Write program in C Programming Languages based on course of PHY 105 and involving computations relevant to Physics.

### PHY 201: ELECTRONICS

1. **Operational Amplifiers:** Differential amplifier - circuit configurations - dual input, balanced output differential amplifier, DC analysis, inverting and non-inverting inputs, CMRR-constant current bias level translator. Block diagram of typical OP-Amp analysis. Open loop configuration, inverting and non-inverting amplifiers, Op-Amp with negative feedback, voltage series feedback, effect of feed back on closed loop gain, input resistance, bandwidth and output offset voltage, voltage follower. Practical Op-Amp,

input offset voltage-input bias current-input offset current, total output offset voltage, CMRR frequency response. DC and AC amplifier, integrator and differentiator.

2. **Oscillators and wave shaping Circuits:** Oscillator Principle, Frequency stability response, the phase shift oscillator, Wein bridge oscillator, LC tunable oscillators, Multivibrators- Monostable, astable and bistable, Comparators, Square wave and triangle wave generation, clamping and clipping circuits.
3. **Digital Electronics:** Combinational logic: Standard representations for logic functions, Karnaugh Map Representation of logical functions, Simplification of logical functions using K-Map, Minimization of Logical functions specified in Minterms / Maxterms or truth table, Don't care conditions, Adder (half and full), Subtractor (half and full), comparator, Multiplexers and their uses, Demultiplexer / Decoders and their uses. BCD arithmetics, Parity generators / Checkers, Code Converters, Priority Encoders, Decoder / Drivers for display devices, Seven Segment display device. ROM, Programmable Logic Array. Basic concepts about fabrication and characteristics of integrated circuits.
4. **Sequential Logic:** Flip-Flops: one - bit memory, RS, JK, JK master slave, T and D type flip flops, shift registers - synchronous and asynchronous counters, cascade counters, Binary counter, Decade counter. A/D and D/A conversion- Basic principles, circuitry and simple applications. Voltage regulators - fixed regulators, adjustable voltage regulators, switching regulators. Basic idea of IC 555 and its applications as multivibrator and square wave generator. Opto-electronic Devices: Photo diode, Phototransistor, Light emitting Diode and their applications

**Text and Reference Books:**

1. "Electronic Devices and Circuit Theory" by Robert Boylested and Louis Nashdsky, PHI, New Delhi - 110001, 1991.
2. "OP-AMP and Linear Integrated Circuits" by Ramakanth, A. Gayakwad, PHI, Second Edition 1991.
3. "Digital Principle and Applications" by A.P. Malvino and Donald P. Leach, Tata McGraw Hill Company, New Delhi, 1993.

**PHY 202 : ATOMIC AND MOLECULAR PHYSICS**

1. Gross structure of energy spectrum of hydrogen atom. Non degenerate first order perturbation method, relativistic correction to energy levels of an atom, atom in a weak uniform external electric field – first and second order Stark effect, calculation of the polarizability of the ground state of hydrogen atom and of an isotropic harmonic oscillator; degenerate stationary state perturbation theory, linear Stark effect for hydrogen atom levels, inclusion of spin orbit interaction and weak magnetic field, Zeeman effect, effect of strong magnetic field. Magnetic dipole interaction, hyperfine structure and Lamb shift (only qualitative description).
2. Indistinguishability and exchange symmetry, many particle wave functions and Pauli's exclusion principle, spectroscopic terms for atoms. The helium atom, Variational method and its use in calculation of ground state energy. Hydrogen

molecule, Heitler London method for hydrogen molecule. WKB method for one dimensional problem, application to bound states (Bohr Sommerfeld quantization) and the barrier penetration.

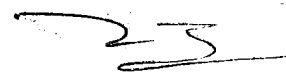

3. Spectroscopy (qualitative): General features of the spectra of one and two electron system – singlet, doublet and triplet characters of emission spectra, general features of alkali spectra. Rotation and vibration band spectrum of a molecule, P, Q and R branches. Raman spectra for rotational and vibrational transitions, comparison with infrared spectra – application to learning about molecular symmetry. General features of electronic spectra, Frank and Condon's principle.
4. Laser cooling and trapping of atoms: The scattering force, slowing an atomic beam, chirp cooling, optical molasses technique, Doppler cooling limit, magneto optical trap. Introduction to the dipole force, theory of the dipole force, optical lattice. Sisyphus cooling technique – description and its limit. Atomic fountain. Magnetic trap (only qualitative description) for confining low temperature atoms produced by Laser cooling, Bose-Einstein condensation in trapped atomic vapours, the scattering length, Bose-Einstein condensate, coherence of a Bose-Einstein Condensate, The Atom Laser.

#### Reference Books :

1. G. Banewell – Atomic and Molecular spectroscopy
2. Christopher J. Foot – Atomic Physics, Oxford Master series, 2005
3. G.K. Woodgate, Elementary Atomic Structure, Second Edition Clarendon Press, Oxford.
4. T.A. Littlefield - Atomic and Molecular Physics.
5. Eisberg and Resnick- Quantum Physics of Atoms. Molecules Solids and Nuclear Particles.
6. Ashok Das and A.C. Melfessions. Quantum Mechanics ; A Modern Approach (Gordon and Breach Science Publishers).
7. White - Atomic Spectra.
8. Herzberg- Molecular spectra.

#### PHY 203 CLASSICAL ELECTRODYNAMICS –II

1. Plane Electromagnetic Waves and Wave Equation : Plane wave in a nonconducting medium. Frequency dispersion characteristics of dielectrics, conductors and plasma, waves in a conducting or dissipative medium, superposition of waves in one dimension, group velocity, causality connection between D and E. Kramers-Kronig relation.
2. Magnetohydrodynamics and Plasma Physics : Introduction and definitions, MHD equations, Magnetic diffusion, viscosity and pressure, Pinch effect, instabilities in pinched plasma column, Magnetohydrodynamics waves, Plasma oscillations, short wave length limit of plasma oscillations and Debye shielding distance.
3. Covariant Form of Electrodynamics Equations : Mathematical properties of the space-time special relativity, Invariance of electric charge covariance of electrodynamics. Transformation of electromagnetic field.

Radiation by moving charges : Lienard-Wiechert Potential for a point charge, Total power radiated by an accelerated charge : Larmor's formula and its relativistic generalization, Angular distribution of radiation emitted by an accelerated charge, Radiation emitted by a charge in arbitrary extremely relativistic motion. Distribution in frequency and angle of energy radiated by accelerated charges, Thomson scattering and radiation, Scattering by quasifree charges, coherent and incoherent scattering, Cherenkov radiation.

4. Radiation damping, self fields of a particle, scattering and absorption of radiation by a bound system ; Introductory considerations, Radiative reaction force from conservation of energy, Abraham Lorentz evaluation of the self force, difficulties with Abraham Lorentz model, Integro-differential equation of motion including radiation damping, Line Breadth and level shift of an oscillator, Scattering and absorption of radiation by an oscillator, Energy transfer to a harmonically bound charge.

#### Reference Books :

1. Classical Electrodynamics : Jackson
2. Classical Electricity and Magnetism : Panofsky and Philips.
3. Introduction to Electrodynamics : Griffiths.
4. Classical Theory of Field : Landan and Lifshitz.
5. Electrodynamics of Continuous Media . Landau and Litshitz.

#### PHY 204: NUMERICAL METHODS

1. Errors in Numerical Analysis: Source of Errors, Round off error, Computer Arithmetic, Error Analysis, Condition and stability, Approximation, Functional and Error analysis, the method of Undetermined Coefficients. use of interpolation formula, Iterated interpolation, Inverse interpolation, Hermite interpolation and Spline interpolation, Solution of Linear equations : Direct and Iterative methods, Calculation of eigen values and eigen vectors for symmetric matrices.
2. Solution of Nonlinear equation : Bisection method, Newton's method, modified Newton's method, method of Iteration, Newton's method and method of iteration for a system of causation Newtons' method for the case of complex roots. Integration of a function. Trapezoidal and Simpson's rules. Gaussian quadrature formula, Singular integrals, Double integration.
3. Integration of Ordinary differential equation : Predictor-corrector methods, Runge-Kutta method. Simultaneous and Higher order equations. Numerical Integration And Differentiation of Data, Least-Squares Approximations, Fast Fourier Transform.
4. Elementary probability theory, random variables, binomial, Poisson and normal distributions.

**PHY 111 / PIY 211 Electronics Lab/ General Lab/ Spectroscopy Lab Experiments**

1. To design a single stage amplifier of a given voltage gain and lower cut of frequencies.
2. To determine Lo. Co. and Rf of a given coil and to study the variations of Rf with frequency.
3. To design a RC coupled two stage amplifier of a given gain and the cutoff frequencies.
4. To study Hartley oscillator.
5. To Study Transistor bias Stability.
6. To design a Multi-vibrator of given frequency and study its wave shape.
7. To study the characteristics of FET and use it to design an relaxation oscillator and measure its frequency.
8. To study the characteristics of an operational amplifier.
9. To study the characteristics of a UJT and use it to design a relaxation oscillator and measure its frequency.
10. To study the addition, integration and differentiation properties of an operational amplifier.
11. Determine Plack constant using solar Cell.
12. To determine Plack constant and work function by a photo-cell.
13. To study regqlated power supply using (A) Zener diode only (b) Zener diode with a series transistor (c) Zener diode with a shunt transistor.
14. To verify Fresnel's formula;
15. To study the percentage regulation and variation of Ripple factor, withload for a full wave rectifier. .
16. To study analog to digital and digital to analog conversion.
17. To study a driven mechanical oscillator.
18. To verify Hartmann's formula using constant deviation spectrograph.
19. To find e/m of electron using Zeeman effect.
20. To find Dissociation energy to I.
21. Study of CH Bands.
22. Salt Analysis / Raman effect (Atomic).
23. Design and study of pass filters.
24. Michelson Interferometer.
25. Fabry parot Interferometer.
26. Determination of velocity of Ultrasonic waves.
27. Study of Eliptically polarised light by Babinet Compensator.
28. Veafication of Cauchy's Dispersion relation.
29. Study of DC gatecontrol characteristics and Anode current characteristics of SCR.

**PHY 212 : Numerical Methods Implementations using C Lab**

Write program in C Programming Languages based on course of PHY 204 and involving computations relevant to Physics.

## PHY 301 : ADVANCED QUANTUM MECHANICS

1. Scattering (non-relativistic) : Differential and total scattering cross section, transformation from CM frame to Lab frame, solution of scattering problem by the method of partial wave analysis, expansion of a plane wave into a spherical wave and scattering amplitude, the optical theorem, Applications-scattering from a delta potential, square well potential and the hard sphere scattering of identical particles, energy dependence and resonance scattering. Breit-Wigner formula, quasi stationary states.

The Lippman-Schwinger equation and the Green's functions approach for scattering problem, Born approximation and its validity for scattering problem, Coulomb scattering problem under first Born approximation in elastic scattering.

2. Relativistic Formulation and Dirac Equation : Attempt for relativistic formulation of quantum theory, The Klein-Gordon equation, Probability density and probability current density, solution free particle K.G. equation in momentum representation, interpretation of negative probability density and negative energy solutions.

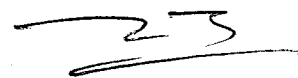

Dirac equation for a free particle, properties of Dirac matrices and algebra of gamma matrices, non-relativistic correspondence of the Pauli equation (inclusive of electromagnetic interaction). Solution of the free particle Dirac equation, orthogonality and completeness relations for Dirac spinors, interpretation of negative energy solution and hole theory.

3. Symmetries of Dirac Equation : Lorentz covariance of Dirac equation, proof of covariance and derivation of Lorentz boost and rotation matrices for Dirac spinors, Projection operators involving four momentum and spin, Parity (P), charge conjugation (C), time reversal (T) and CPT operators for Dirac spinors, Bilinear covariants, and their transformations, behaviour under Lorentz transformation, P,C,T and CPT, expectation values of coordinate and velocity involving only positive energy solutions and the associated problems, inclusion of negative energy solution, Zitterbewegung, Klein paradox.

4. The Quantum Theory of Radiation : Classical radiation field, transversality condition, Fourier decomposition and radiation oscillators, Quantization of radiation oscillator, creation, annihilation and number operators, photon states, photon as a quantum mechanical excitation of the radiation field, fluctuations and the uncertainty relation, validity of the classical description, matrix element for emission and absorption, spontaneous emission in the dipole approximation, Rayleigh scattering, Thomson scattering and the Raman effect, Radiation damping and Resonance fluorescence.

### Reference Books :

1. Ashok Das and A.C. Milissiones : Quantum mechanics - A Modern Approach (Garden and Breach Science Publishers).
2. Eugen Merzbacher : Quantum Mechanics, Second Edition (John Wiley and Sons).
3. Bjorken and Drell : Relativistic Quantum Mechanics (McGraw Hill).
4. J.J. Sakurai : Advanced Quantum Mechanics (John Wiley)

## PHY 302: STATISTICAL AND SOLID STATE PHYSICS

### 1. Basic Principles, Canonical and Grand Canonical ensembles :

Concept of statistical distribution, phase space, density of states Liouville's theorem, systems and ensemble, entropy in statistical mechanics Connection between thermodynamic and statistical quantities micro canonical ensemble, equation of state, specific heat and entropy of a perfect gas, using microcanonical ensemble.

Canonical ensemble, thermodynamic functions for the canonical ensemble, calculation of means values, energy fluctuation in a gas, grand canonical ensemble, thermodynamic functions for the grand canonical ensemble, density fluctuations.

### 2. Partition functions and Statistics : Partition functions and properties, partition function for an ideal gas and calculation of thermodynamic quantities, Gibbs Paradox, validity of classical approximation, determination of translational, rotational and vibration contributions to the partition function of an ideal diatomic gas. Specific heat of a diatomic gas, ortho and para hydrogen.

Identical particles and symmetry requirement, difficulties with Maxwell-Boltzmann statistics, quantum distribution functions, Bose Einstein and Fermi-Dirac statistics and Planck's formula, Bose Einstein condensation, liquid He4 as a Boson system, quantization of harmonic oscillator and creation and annihilation of phonon operators, quantization of fermion operators.

### 3. Theory of Metals : Fermi-Dirac distribution function, density of states, temperature dependence of Fermi energy, specific heat, use of Fermi-Dirac statistics in the calculation of thermal conductivity and electrical conduction band, Drude theory of light, absorption in metals.

### 4. Band Theory : Bloch theorem, Kronig Penny model, effective mass of electrons, Wigner-Seitz approximation, NFE model, tight binding method and calculation of density for a band in simple cubic lattice, pseudo potential method.

#### Reference Books :

1. Huang : Statistical Mechanics
2. Reif : Fundamentals of Statistical and Thermodynamical Physics.
3. Rice : Statistical mechanics and Thermal Physics.
4. Kittel : Elementary statistical mechanics.
5. Kittel : Introduction to solid state physics.
6. Palteros : Solid State Physics.
7. Levy : Solid State Physics.

## PHY 302 : NUCLEAR PHYSICS-I

1. Two Nucleon system and Nuclear forces : General nature of the force between nucleons, saturation of nuclear forces, charge independence and spin dependence, General forms of two nucleon interaction, Central, noncentral and velocity dependent potential, Analysis of the ground state ( $^3S_1$ ) of deuteron using a square well potential, range-depth relationship, excited states of deuteron, Discussion of the ground state of

23

- deuteron under noncentral force, calculation of the electric quadrupole and magnetic dipole moments and the D-state admixture.
2. Nucleon-Nucleon Scatterign and Potentials : partial wave analysis of the neutron-proton scattering at low energy assuming central potential with square well shape, concept of the scattering length, coherent scattering of neutrons by protons in (ortho and para), hydrogen molecule; conclusions of these analyses regarding scattering lengths, range and depth of the potential; the effective range theory (in neutron-proton scattering)\_ and the shape independence of nuclear potential: the effective range theory (in neutron-proton scattering) and the shape independence of nuclear potential; A qualitative discussion of proton-proton scattering at low energy; General features of two-body scatterign at high energy effect of exchange forces. Phenomemonological Hamada-Johnston ahard core potential ad Reid hard core and soft core potentials; Main features of the One Boson Exchange Potentials (OBEP) no derivation.
  3. Interaction of radiation and charged particle with matter (Not derivation) : Law of absorption and attenuation coefficient photoelectric effect, Compton, scattering, pair production; Klein-Nishina cross sections for polarized and unpolarized radiation angular distribution of scattered photon and electrons, Energy loss of charged particles due to ionization, Bremsstrahlung; energy target and projectile dependence of all three processes, Range-energy curves; Straggling.
  4. Experimental Techniques : Gas filled counters; Scintillation counter; Cerenkov counters; Solid state detectors; Surface barrier detectors; Electronic circuits used with typical nuclear detector; Multiwire proportion chambers; Nuclear emulsions, techniques of measurement and analysis of tracks; Proton synchrotron; Linear accelecrators; Acceleration of heavy ions.

15. Harvey : introduction of Nuclear Physics and Chemistry.

### PHY 311 / PHY 411 Advance Physics Laboratory Work

1. To determine half-life of a radio isotope using GM counter.

2. To study absorption of particles and determine range using at least two sources.
3. To study characteristics of a GM counter and to study statistical nature of radioactive decay.
4. To study spectrum of  $\beta$ - particles using Gamma ray spectrometer.
5. To calibrate a scintillation spectrometer and determine energy of  $\gamma$ -rays from an unknown source.
6. (a) To study variation of energy resolution for a Nai (Tp) detector.  
(b) To determine attenuation coefficient ( $\mu$ ) for rays from a given sources.
7. To study Compton scattering of gamma rays and verify the energy shift formula.
8. To study temperature variation of resistivity for a semi-conductor and to obtain band gap using four probe method.
9. To study hall effect and to determine hall coefficient.
10. To study the variation of rigidity of a given specimen as a function of the temperature.
11. To study the dynamics of a lattice using electrical analog.
12. To study ESR and determine g-factor for a given spectrum.
13. To determine ultrasonic velocity and to obtain compressibility for a given liquid.
14. Study the characteristics of a given Klystron and calculate the mode number, E.T.S. and transit time.
15. Study the simulated L.C.R. Transmission line (audio frequency) and to find out the value for  $Z_0$  experimentally from the graph.
16. Study the radiation pattern of a given Pyramidal horn by plotting it on a Polar graphy paper. Find the half power beam width and calculate its gain.
17. Find the dielectric constant of a given solid (Teflon) for three different lengths by using slotted section.
18. Find the dielectric constant of a given liquid (organic) using slotted section of X-band.
19. Verification of Bragg's law using microwaves.

### PHY 312: Elective Laboratory Work

Laboratory work based on curriculum of elective papers taken in the semester.

### PHY 401: INTRODUCTORY QUANTUM FIELD THEORY

1. Scalar and Vector fields, Classical Lagrangian field theory, Euler Lagrange's equation, Lagrangian density for electromagnetic field. Occupation number representation for simple harmonic oscillator, linear array of coupled oscillators, second quantization of identical bosons, second quantization of the real Klein-Gordon Field and Complex Klein-Gordon field, the meson propagator.
2. The occupation number representation for fermions, second quantization of the Dirac

- field, the fermion propagator, the em interaction and gauge invariance, covariant quantization of the free electromagnetic field, the photon propagator.
3. S-matrix, the S-matrix expansion, Wick's theorem, Diagrammatic representation in configuration space, the momentum representation, Feynman diagrams of basic processes, Feynman rules of QED.
  4. Applications of S-matrix formalism : The Coulomb scattering, Bhabha scattering, Moller scattering, and Compton scattering.

**Reference Books :**

1. Quantum Field Theory by F. Mandal & G. Shaw (Honnh-Wiley).
2. Relativistic Quantum Mechanics by J.D. Bjorken & S. Drell (McGraw Hill Book Co.).
3. Advanced Quantum Mechanics by J.J. Sakaurai.
4. Element of Advanced Quantum Theory by J.M. Ziman. (Cambridge University Press).

**PHY 402 : SOLID STATE PHYSICS**

1. Lattice Dynamics and Optical Properties of Solids : Interatomic forces and lattice dynamics and simple metals, ionic and covalent crystals. Optical phonons and dielectric constants. Inelastic neutron scattering. Mossbauer effect. Debye-Waller factor. Anharmonicity, thermal expansion and thermal conductivity. Interaction of electrons and phonons with photons. Direct and indirect transitions Absorption in insulators, Polaritons, one-phonon absorption, optical properties of metals, skin effect and anomalous skin effect.
2. Semiconductors : Law of mass action, calculation of impurity conductivity, ellipsoidal energy surfaces in Si and Ge, Hall effect, recombination mechanism, optical transitions and Schockely-Read theory, excitons, photoconductivity, photoluminescence. Points line, planar and bulk defects, colour centres, F-centre and aggregate centres in alkali halides.
3. Magnetism : Larmor diamagnetism. Paramagnetism, Curie Langevin and Quantum theories. Susceptibility of rare earth and transition metals. Ferromagnetism : Domian theory, Weiss molecular field and exchange, spin waves: dispersion relation and its experimental determination by inelastic neutrons scattering, heat capacity. Nuclear Magnetic resonance : Conditions of resonance, Bloch equations. NMR-experiment and characteristics of an absorption line.
4. Superconductivity :
  - (a) Experimental Results : Meissner effect, heat capacity, microwave and infrared properties, isotope effect, flux quantization, ultrasonic attenuation, density of states, nuclear spin relaxation, Giaver and AC and DC Josephson tunnelings.
  - (b) Cooper pairs and derivation of BCS Hamiltonian, results of BCS Theory (no derviation).

**Reference Books :**

1. Kittle : Introduction to Solid State Physics, 5th Edition (John Wiley).

23

2. Levy-Solid State Physics.
3. Patterson - Solid State Physics.
4. Mckelvy - Solid State and Semi-conductor Physics.

### PHY 403 : NUCLEAR PHYSICS-II

1. Nuclear Shell Model : Single particle and collective motions in nuclei : Assumptions and justification of the shell model, average shell potential, spin orbit coupling; single particle wave functions and level sequence; magic numbers; shell model predictions for ground state parity; angular momentum, magnetic dipole and electric quadrupole moments; and their comparison with experimental data; configuration mixing; single particle transition probability according to the shell model; selection rules; approximate estimates for the transition probability and Weisskopf units; Nuclear isomerism.
2. Collective Nuclear Models : Collective variable to describe the cooperative modes of nuclear motion; Parameterization of nuclear surface; A brief description of the collective model Hamiltonian (in the quadratic approximation); Vibrational modes of a spherical nucleus, Collective modes of a deformed even-even nucleus and moments of inertia; Collective spectra and electromagnetic transition in even nuclei and comparison with experimental data; Nilsson model for the single particle states in deformed nuclei.
3. Nuclear Gamma and Beta decay : Electric and magnetic multipole moments and gamma decay probabilities in nuclear system (no derivations) Reduced transition probability, Selection rules; Internal conversion and zero-zero transition. General characteristics of weak interaction; nuclear beta decay. and lepton capture; electron energy spectrum and Fermi-Kurie plot; Fermi theory of beta decay (parity conserved selection rules Fermi and Gamow-Teller) for allowed transitions; ft-values; General interaction hamiltonian for beta decay with parity conserving and non conserving terms; Forbidden transitions; Experimental verification of parity violation; The V-A interaction and experimental verification.
4. Nuclear Reaction s: Theories of Nuclear Reactions; Partial wave analysis of reaction Cross section; Compound nucleus formation and breakup; Resonance scattering and reaction-Breit-Wigner dispersion formula for s-waves ( $l = 0$ ), continuum cross section; Statistical theory of nuclear reactions, evaporation probability and cross section for specific reactions; The optical model, Stripping and pick-up reactions and their simple theoretical description (Butler theory) using plane wave Born approximation (PWBA) Shortcomings of PWBA Nuclear structure studies with deuteron stripping (d, p) reactions.

### PHY 412 Elective Laboratory Work

Laboratory work based on curriculum of elective papers taken in the semester.

#### PHY A01: ASTROPHYSICS – I

1. Astronomy fundamentals, Black body radiation, Radiation mechanism, Flux density and luminosity, basics of Radiative transfer and Radiative processes, Magnitudes, Motions and Distances of Stars : Absolute stellar magnitude and distance modulus, Bolometric and radiometric magnitudes, Colour-index and luminosities of stars,
2. Stellar positions and motions, Velocity dispersion, Statistical and moving cluster parallax, Extinction, Stellar temperature, Effective temperature, Brightness temperature, Color temperature, Kinetic temperature, Excitation temperature, Ionization temperature, Spectral Classification of stars, Utility of stellar spectrum, stellar atmospheres.
3. Overview of the major contents of the universe, Sun and stars, stellar interiors, HR diagram, nuclear energy generation, neutrino astronomy, white dwarfs and neutron stars, plasma processes, compact objects, shape, size and contents of our galaxy
4. Basics of stellar dynamics, normal and active galaxies, gravitational wave astronomy, Newtonian cosmology, microwave background, early universe.

#### *Reference Books:*

1. Theoretical Astrophysics, Vols.1-3, Padmanabhan, T., Cambridge University Press, 2005.
2. An Introduction to Modern Astrophysics: B.W.Carrol & D.A.Ostlie
3. Astrophysical Concepts : M.Harwit
4. An Introduction to Astrophysics : Baidyanath Basu
5. Astronomical Physics : Stars and Galaxies : K.D.Abhayankar
6. The Sun : An Introduction : M.Stix
7. Stellar Atmospheres : D.Mihalas
8. An Introduction to the Study of Stellar Structures : S.Chandrasekhar
9. Spherical Astronomy : W.M.Smart

#### PHY A02: ASTROPHYSICS – II

1. Coordinate systems, precession, time, heliocentric corrections; methods of observation, resolution, sensitivity, noise, quantum efficiency, spectral response, Johnson noise, signal to noise ratio, background, aberrations, 2.
2. Telescopes at different wavelengths, detectors at different wavelengths, imaging, spectroscopy, polarimetry, calibration, atmospheric effects at different wavelengths, active/adaptive optics, interferometry, speckle interferometry, aperture synthesis, methods of data reduction,

3. Fourier transforms, calibrations; neutrino astronomy, gravitational wave astronomy. Numerical techniques in physics and astrophysics, errors and error propagation, numerical integration and interpolation, random numbers, astrostatistics, probability distributions, hypothesis testing, sampling methods,
4. Multivariate analysis, regression, time-series analysis, data reduction, error analysis, numerical solutions of algebraic, ordinary differential and partial differential equations.

**Reference Books:**

1. Roy, A.E., & Clarke, D., Astronomy Principles and Practice, 4th ed., Institute of Physics, 2003.

5. Babu G. J. & Fiegelson, E. D., Astrostatistics, Chapman and Hall, 1996.
6. Saha S. K., Diffraction-limited imaging with large and moderate telescopes, World Scientific, New Jersey, 2007

**PHY A03: General Theory of Relativity**

1. Principle of equivalence. Metric formulation and tensor nature of gravitational field. Geodesic motion in curved space-time. Gradient, divergence, curl, and curvature and torsion in General Relativity.
2. Bianchi identity and curvature tensor. Einstein's field equation and gravitation. Schwarzschild metric and solutions of Einstein's equation.
3. Three crucial tests of Einstein's theory of gravitation. Killing vectors. Theory of gravitational waves.
4. Singularities of Schwarzschild metric and Penrose diagrams. Ray-Chaudhary equation.

**Reference Books:**

1. S. Weinberg, Gravitation and Cosmology.
2. S. Carroll, General Relativity.

**PHY A04: Cosmology**

1. Einstein's model of Universe. De-Sitter Universe. Friedman-Robertson-Walker-Lemaitre model of the Universe. Big-Bang and the Physics of the early Universe.
2. Particle and the Nucleo-synthesis in the early Universe. Various phase transitions and time-line of the Universe.
3. Inflationary cosmology and generation of density perturbations.
4. Alternative cosmologies: Quasi-Steady State Theory of the Universe.

**PHY A05: Quantum Gravity and Quantum Cosmology**

1. The need for a theory of Quantum Gravity and Quantum Cosmology. Physics at short distance. Big-Bang and Physics at Planck scale: Planck length, Planck time, Planck mass, and Planck energy.
2. Black-Hole Physics and Hawking radiations. Unification of Gravity with other fundamental interactions.
3. Overview of diverse approaches to Quantum Gravity: Geometrodynamics; Loop

- Quantum Gravity and Loop Quantum Cosmology;  
4. Quantum Gravity in Super-String Theory.

**PHY A06: Precision Tests in Astrophysics and Cosmology**

1. Recent experimental results on Cosmic Microwave Background Radiations. Results of WMAP experiments and COBE experiments.
2. The experimental evidence of dark matter and dark energy.
3. Gravitational Wave detectors. Super-Novae as standard candles
4. Precision experiments in Astrophysics and Cosmology.

**PHY B01: Condensed Matter Physics-I**

1. Phase transformation and alloys: Equilibrium transformation of first and second order, equilibrium diagrams, phase rule, interpretation of phase diagrams, substitutional solid solutions, Vegard's law, intermediate phases, Hume-Rothery rules, interstitial phases (carbides, nitrides, hydrides, borides). Martensitic transitions.
2. High temperature superconductors and GMR/CMR materials: High temperature superconductors, normal state properties (structural phase transition) of cuprates, phase separation and charge distribution into CuO<sub>2</sub> planes, striped phase, phase diagram, pseudogap, dependence of  $T_c$  on crystal structure. effect of impurities GMR/CMR materials, Ruddlesden-Popper series of perovskites. Onset of ferromagnetism and metallic conduction. Double exchange.
3. Novel organic materials : Special carbon solids, fullerenes and tubules, formation and characterization of fullerenes and tubules. Single wall and multi-wall carbon tubules. Electronic properties of tubules. Carbon nanotubule based electronic devices. Polymers – amorphous polymers, glass transition temperature, effect of molecular architecture on glass transition temperature, free volume theory for glass transition, conducting polymers, optical band gap of polymers, electrical conduction in conducting polymers, mechanical and thermal properties of polymers, polymer blends and composites.
4. Structural characterization and electron structure determination: Basic theory of X-ray diffraction, indexing of Debye-Scherrer patterns from powder samples, examples from some cubic and non-cubic symmetries. Neutron diffraction – basic interactions, cross section, scattering length and structure factor. Basic principles of X-ray absorption spectroscopy, photo emission and positron annihilation techniques. Qualitative discussion of experimental arrangement and of typical results for both simple as well as transition metals.

**Books**

1. Andrei Mourachkine: Room temperature superconductivity, Cambridge International Science Publishing.
2. C.N.R. Rao: Colossal magnetoresistance, charge ordering and related properties of manganese oxide, World Scientific, 1998
3. Polymer Physics by Ulf W. Gedde, Chapman & Hall, 2001.
4. Introduction to Polymer Physics by David. I. Bower.
5. Polymer Science by J.R. Fried.

## PHY B02: Condensed Matter Physics-II

1. **Disordered systems** Substitutional, positional and topographical disorder, short and long range order, glass transition, glass forming ability, nucleation and growth processes. Anderson model for random system and electron localization, mobility and hopping conduction. Metglasses, models for structure of metal glasses. Structure factor for binary metallic glasses and its relationship with radial distribution function. Discussion of electric, magnetic and mechanical properties of glassy systems. Point defects: shallow impurity states in semiconductors. Localized lattice vibrational states in solids. Vacancies, interstitials and colour centres in ionic crystals.
2. **Nanomaterials:** Free electron theory (qualitative idea), variation of density of states with energy, variation of density of state and band gap with size of crystal. Electron confinement in infinitely deep square well, confinement in two and one dimensional well, idea of quantum well structure, tunneling through potential barrier, quantum dots, quantum wires. Different methods of preparation of nanomaterials. Sol-gel and chemical co-precipitation method, effect of temperature on the size of the particles. Bottom up: cluster beam evaporation, ion beam deposition, top down: ball milling. DC and RF sputtering.
3. **Films and surfaces** Study of surface topography by multiple beam interferometry, conditions for accurate determination of step height and film thicknesses (Fizeau fringes). Electrical conductivity of thin films, difference of behaviour of thin films from bulk material, Boltzman transport equation for a thin film (for diffuse scattering), expression for electrical conductivity for thin film. Enhancement of magnetic anisotropy due to surface pinning.
4. **Experimental techniques** Basic ideas of the techniques of field emission, scanning tunnelling and atomic force microscopy, scanning electron microscopy, transmission electron microscopy, X-ray diffraction line broadening, small angle X-ray scattering and small angle neutron scattering.

### Books

1. Tolansky: Multiple beam interferometry
2. Heavens: Thin films
3. Chopra: Physics of thin films
4. Quantum dot heterostructures: D. Bimerg, M. Grundmann and N.N. Ledestov, John Wiley & Sons, 1998
5. Nano particles and nano structured films - preparation, characterization and applications, Ed. J.H. Fendler, John Wiley & Sons, 1998.
6. Physics of low dimensional semiconductors: John H. Davies, Cambridge Univ. Press, 1997
7. Physics of semiconductor nano structures: K.P. Jain, Narosa, 1997

8. Nanostructures and nanomaterials: synthesis properties and applications by Guozhong Cao, P\Impertial College Press, 2004
9. Fundamentals of Nanoelectronics by George W. Hanson, Pearson Education, 2009.
10. Nanotechnology: Principles and practices by Sulabha Kulkarni, Capital Publishing Company, 2009.
11. Handbook of Nanostructured materials and nanotechnology

### PHY C01: High Energy Physics I

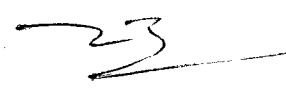

1. Elementary particles and the fundamental forces. Quarks and leptons. The mediators of the electromagnetic, weak and strong interactions. Interaction of particles with matter; particle acceleration, and detection techniques. Symmetries and conservation laws.
2. Bound states. Discoveries and observations in experimental particle physics and relation to theoretical developments. Symmetries, group theory, The group SU(2), Finite Symmetry Group: P and C, SU(2) of Isospin, The group SU(3)
3. Quark and Antiquark states: Mesons, Three quark states: Baryon, color factors, Asymptotic freedom. Charged and neutral weak interactions. Electroweak unification.
4. Decay rates. Cross sections. Feynman diagrams Introduction to Feynman integrals. The Dirac equation. Feynman rules for quantum electrodynamics (no derivation). Moller scattering, trace theorems and properties of gamma matrices, helicity representation at high energies., the electron propagator, the photon propagator.

### Recommended books

1. Francis Halzen and Allan D. Martin, **Quarks and Leptons: An Introductory Course in Modern Particle Physics**, John Wiley and Sons
2. B.R. Martin and G. Shaw, **Particle Physics**, 2nd edition, J. Wiley and Sons (1997).
3. **The Review of Particle Physics**, (Particle Data Group
4. David Griffiths, **Introduction to Elementary Particles**
5. Byron Roe **Particle Physics at the New Millennium**
6. Donald Perkin, **Introduction to high energy physics**.
7. Martin and Shaw, **Particle Physics**

### PHY C02: High Energy Physics II

1. Structure of Hadrons: form factors, e-p scattering, inelastic e-p scattering, Bjorken scaling, Partons, gluons, deep inelastic scattering, evolution equations for parton densities.
2. QCD: Electron positron annihilation into hadrons, heavy quark production, three jet events, QCD corrections, Perturbative QCD, Drell-Yan process
3. Weak Interactions: Parity violation, V-A form of weak interaction, Nuclear beta decay, muon decay, pion decay, charged current neutrino electron scattering, neutrino quark scattering, weak neutral currents, the Cabibo angle, weak mixing angles, CP invariance.

4. Gauge Symmetries: U(1) Local gauge invariance and QED, Non-abelian gauge invariance and QCD, massive gauge bosons, spontaneous breakdown of symmetry, the Higgs mechanism.

Recommended books

1. Francis Halzen and Allan D. Martin, **Quarks and Leptons: An Introductory Course in Modern Particle Physics**, John Wiley and Sons
2. B.R. Martin and G. Shaw, **Particle Physics**, 2nd edition, J. Wiley and Sons (1997).

5. Byron Roe **Particle Physics at the New Millennium**
6. Donald Perkin, **Introduction to high energy physics**).
7. Martin and Shaw, **Particle Physics**

**PHY C04: Renormalization**

1. Theory of renormalization. The renormalization group and applications to the theory of phase transitions.
2. Renormalization of Yang-Mills theories.
3. Applications of the renormalization group of quantum chromodynamics.
4. Perturbation theory anomalies. Applications to particle phenomenology.

23

### PHY C05: Supersymmetry

1. Grand unification, gauge coupling unification, proton decay;
2. Naturalness and the hierarchy problem; technicolor;
3. The supersymmetric Standard Model, supersymmetric unification,
4. SUSY dark matter, SUSY flavor problem.

### PHY C05: Physics Beyond the Standard Model

1. Introduction to general relativity. and Curvature, energy-momentum tensor, Einstein field equations.
2. Evolution of the Universe based on the theory of general relativity.
3. Test of the models and the nature of dark matter and dark energy.
4. TeV scale gravity; the cosmological constant problem, Large extra dimensions.

### PHY D01: Electronics and Communication - I

1. **Microwave Components:** Field distribution in rectangular waveguide in TE and TM modes, Phase velocity, Group velocity, Characteristic impedance, wall current, cylindrical cavity resonators and their excitation techniques, Scattering matrix for Microwave Tees and hybrid junction directional coupler, Construction and working of precision attenuator and phase shifter.
2. **Solid State Devices:** Microwave propagation in ferrites, Faraday rotation, Microwave devices employing Faraday rotation: Gyrator, Isolator and Circulator, Solid state devices: Avalanche transit time devices: Read diode, negative resistance of an avalanching p-n junction diode, Transferred electron devices: Gunn effect, two valley model, High field domains, Different modes for microwave generation, Parametric devices: Varactor, Nonlinear reactance and Manley- Rowe power relations, Parametric Up-converter amplifier and its noise properties.
3. **Power Electronics:** Characteristics of power diodes, power transistor, TRIAC and DIAC. SCR: Construction and its characteristics, simple firing circuit using UJTs. Controlled rectifiers: Single and three phase half wave and full wave controlled rectifiers. Commutation Circuits: Line commutation and different commutation circuits, Inverters: Single phase tapped and bridge inverter circuits, Basic chopper circuits, 2 and 4 quadrant choppers. Principle of operation of cycloconverter.
4. **Measuring devices:** Microwave Measurements: Power, frequency, attenuation and VSWR measurements, Return loss measurement, Concept of Smith chart and its use in impedance measurement, Microwave antenna measurement, measurement of dielectric properties of solid materials using wave guide method. Measuring devices: Digital voltmeter- ramp type and integrating type, Measurement of time, phase, frequency using digital instruments, Q meter, Transducers as input elements to instrumentation systems: Classification, constructional and operational features of strain gauges, displacement, velocity, force, torque and pressure transducers.

#### Books:

1. Foundations of Microwave Engineering by R. E. Collins (McGraw Hills)
2. Microwave Devices And Circuits by S. Y. Liao (PHI)

3. Solid state Electronic Devices by Streetman (PHI)
4. Power Electronics – By P.C. Sen
5. Power Electronics- By Dubey
6. Power Electronics- Ramamurthy
7. Industrial Electronics-By G.K. Mittal
8. Power Electronics Systems- By Agarwal ( Pearson Education India)
9. Cooper, W. D. and Helfrick, A. D. “Electronic Instrumentation and Measurement techniques”, Prentice Hall, India.
10. Sawhney, A. K. “Measurement” Dhanpat Rai & Sons.
11. Thomas, H. E. and Clark, C. A. “Handbook of Electronic Instruments and Measurement Techniques”. Prentice Hall, Inc.

### **PHY D02: Electronics and Communication - II**

1. **Conventional Microwave sources and Antennas:** Two cavity Klystron, Reflex Klystron, their working and efficiency. Magnetron and its operating characteristics, Hull cut-off condition. Introduction to Gyatron and Traveling wave tubes: construction and working. Introduction to antenna parameters. Electromagnetic horn antenna. Introduction to microstrip patch antennas and array antennas.
2. **Communication Systems:** Microwave Communication: LOS microwave systems, Derivation of communication range, OTH microwave systems, Derivation of field strength of troposphere waves. Introduction to RADAR, Satellite and Mobile Communications.  
Optical Fiber Communication: Principles of light propagation in fibers, step and graded index fibers, mono mode & multimode fibers; transmission losses, fiber attenuation, bandwidth, power and cut-off wavelength. Multiplexing in fibers.
3. **Communication Electronics:** Amplitude modulation – Generation of AM waves – Demodulation of AM waves – Double-sideband suppressed carrier (DSBSC) modulation . Generation of DSBSC waves, Coherent detection of DSBSC waves, SSB modulation, Generation and detection of SSB waves. Vestigial sideband modulation. Frequency division multiplexing (FDM).
4. **Digital communication:** Principal of Digital Communication, Pulse Modulation Systems: Sampling theorem - Low pass and band pass signals. Natural sampling. Signal Recovery through holding. Pulse code modulation (PCM), Quantization of Signals, Quantization, Differential Pulse code modulation (DPCM), Delta modulation (DM), Adaptive delta modulation (ADM), Noise in pulse code and delta modulation systems. Various Digital Modulation Techniques.

#### Books:

1. Antenna Theory by C. A. Balanis (Harper & Row Pub.)
2. Electromagnetic Waves and Radiating Systems by E. C. Jordon and K. G. Balmain (PHI)
3. Solid State Physical Electronics by Van Der Ziel

4. Microwave Devices And Circuits by S. Y. Liao (PHI)
5. Microwave and Radar Engineering by M.Kulkarni, Umesh Pub.
6. Satellite Communicatios By Dr.D.C.Agrawal, Khanna Pub.
7. Modern Digital and Analog Communication Systems III ed. By B.P. Lathi, Oxford University Press
8. Communications Systems by Taub and Schilling, Mc Graw Hill

#### **PHY D03: Microwave Electronics and Applications**

1. **CIRCUIT THEORY OF WAVE GUIDES:** Power Transmission in Wave Guides, Equivalent Voltages and Currents, Impedance Description of Wave Guide Elements and Circuits, Foster's Reaction Theorem, One Port Circuits, N-Ports Circuits, Scattering Matrix Formulation, Excitation and Coupling of Wave Guides, Dielectric Loaded Wave Guides, Surface Wave Guides.
2. **ANTENNAS:** Familiarity with Different Types of Antennas, Radiation Properties, Strip-Lines and Microstrip Lines, Strip-Line Characteristics, Strip-Line Components, Microstrip Antennas, Radiation Properties of Microstrip Antennas.
3. **APPLICATIONS OF MICROWAVES:** Applications of Microwave in RADAR, Satellite Communication, Mobile Communication, Microwave Heating,
4. **FERRITES** Microwave Propagation in Ferrites, Nano Ferrites, Synthesis of Nano Ferrites, Dielectric Properties of Ferrites, Ferrites as a Microwave Absorbers.

#### **PHY D04: Satellite Communications and Remote Sensing**

1. Principle of Satellite Communication: General and Technical characteristics, Active and Passive satellites, Modem and Codec. Satellite Link Design: General link design equation, Atmospheric and Ionospheric effect on link design, Earth station parameters.
2. Satellite Analog Communication: Baseband analog signal, FDM techniques, S/N and C/N ratio in FM in satellite link. Digital Satellite transmission: Advantages, Elements of digital satellite communication, Digital base band signal, Digital modulation Techniques, Digital link Design, TDM, TDMA, some applications of satellite communications.
3. Concept and Foundations of Remote Sensing: Electromagnetic Radiation (EMR), interaction of EMR with atmosphere and earth surface, Application area of remote Sensing. Characteristics of Remote Sensing Platform & Sensors: Ground, Air & Space platforms, Return Beam Vidicon, Multi-spectral Scanner, Brief idea of Digital Image Processing.
4. Microwave Remote Sensing Tools: Radar Remote Sensing, Microwave Sensing, Lidar (Single and double ended system), (Radar & Lidar): Data Characteristics. Earth Resource Satellites: Brief description of Landsat and Indian remote sensing satellites (IRS) Satellites.

#### **Reference Books:**

1. Satellite Communication : D.C. Agrawal and A. K. Maini.

2. Satellite Communication: T. Pratt and C. W. Bostiern.
3. Satellite Communication System: M. Richharia.
4. Introduction of Remote Sensing: J.B. Campbell.
5. Manual of Remote Sensing Vol I & II: ( Ed. R.N. Colwell).

### PHY E01: ENERGY STUDIES –I

1. Solar Energy : Fundamentals of photovoltaic Energy Conversion Physics and Material Properties Basic to Photovoltaic Energy Conversion : Optical properties o Solids. Direct and indirect transition semiconductors, interrelationship between absorption coefficients and band gap recombination of carriers.
2. Types of Solar Cells, p n junction solar cell, Transport Equation, Current Density, Ipen circuit voltage and short circuit current, Brief descriptions of single crystal silicon and amorphous silicon solar cells, elementary ideas of advanced solar cells e.g. Tandem Solar Cells. solid Liquid Junction Solar Cells, Nature of Semiconductor, Electrolyte Junction, Principles o Photoelectrochemical solar Cells.
3. Hydrogen Energy : Relevance in depletion of fossil fuels and enviromental considerations.  
Hydrogen Production : Solar Hydrogen through Photoelectrolysis and Photocatalytic process. Physics and material characteristics for production of Solar Hydrogen.  
Storage of Hydrogen : Brief discussion of various storage processes, special features of solid state hydrogen storage materials, structuraland electronic characteristics of storage materials. New Storage Modes.
4. Safety and Utilisation of Hydrogen : Various factors relevant to safety, use of Hydrogen as Fuel, Use in Vehicular transport, Hydrogen for Electricity Generation, Fuel Cells, Elementary concepts of other Hydrogen Based devices such as Air Conditioners and Hydride Batteries.  
Other Renewabel Clean Energies : Elements of Solar Thermal Energy, Wind Energy and Ocean Thermal Energy Conversion.

#### Text and Reference Books

1. Fonash : Solar Cell Devices - Physics.
2. Fahrenbruch & Bube : Fundamentals of Solar Cells Photovoltaic Solar Energy.
3. Chandra : Photoelectrochemical Solar Cells.
4. Winter & Nitch (Eds.) : Hydrogen as an Energy Carrier Technologies System Economy.

### PHY E02: ENERGY STUDIES –II

1. Heat conduction : Differential equation of heat conduction, Initial and boundary conditions. methods of solving heat conduction problems : separation of variable method for one dimension, The Greens' functions method, Integral transform method for finite and infinite ranges. Problems with and without internal heat generation. Numerical analysis of transient and periodic state of heat conduction Measurement

- techniques for thermal conductivity and their comparative study (static and dynamic), Guarded not plate method, Thermal probe, parallel wire.
2. Convective and Radiative Heat Transfer : Theory of convective heat transfer, Laminar and turbulent flow, Boundary layer theor. Heat transfer in duct. heat exchangers : basic thermal sign methods. Theory of heat pipes, Design considerations. Applications of heat pipes. Direct and diffused thermal radiation. Radiative properties of real surfaces. Radiation exchange between surfaces. Atmospheric attenuation, solar radiation measurements solar radiation geometry.
  3. Solar Energy collectors : Flat Plate solare energy collectors. Selective absorber surfaces. Transparent plates. Collector energy losses. Thermal analysis of collectors. Air heating collectors. Collector performance testing. Concentrating collectors. Thermal analysis of concentrating collectors. Tracking requirements.
  4. Thermal Energy Storage and Solar Thermal Devices : Storage of solar energy. Water storage. Stratification fo water storage, Packed bed storage. Phase change storage. Solar pond. Chemical storage. Solar space conditioning- Energy requirements in buildings, Passive system architecture, Performance and design; coiling processes. Vapor compression refrigeration cycle, Absorption refrigeration cycel, Performance of solar absorption air conditioning. Solar energy process economics.

3. Conduction of Heat in Solids : H.S., Carslas and J.C.Jsegar, Oxford Clarendon Press 1959.
4. Heat and Mass Transfer : A Luikov, Mir Publichers Moscow.
5. Thermal conductivity of Solids : J.E. Parrot and Audrey D. Stuckers : Pion Limited, London.
6. Solar energy Thermal Processs : Dluffie and Backman. Wiley & Sons. New York.
7. Solar Energy Engg. : Jui Sheng Haieh, Prentic Hall, New Jersey.
8. Solar Energy : S.P, Tata McGraw Hill, New Delhi.

#### PHY F01 : PLASMA PHYSICS-I

1. Basic properties and occurrence. Definition of plasma. Criterla for plasma behaviour, Plasma oscillation. Quasi-neutrality and Debye Shielding. The plasma parameter. natural occurrence of plasma. Astrophysical plasmas. Plasma in Magnetiosphere and ionosphere. Plasma production and diagnostics. Thermal ionization. Saha equation. Brief discussion of methods of laboratory plasma production. Steady stage glow discharge, microwave breakdown and induction discharge, Double Plasma Machine. Elementary ideas about plasma diagnostics. Electrostatic and magnetic probes.
2. Charged particle motion and drifts, Guiding centre motion of a charges particle. Motion in (i) uniform electric and magnetic field (i) gravitational and magnetic fields. Motion in non-uniform magnetic field (i) grad B perpendicular to B, grad B drift and curvature drift (ii) grade B parallel to B and principle of magnetic mirror. Motion in non-uniform electric field for small Larmour radius. Time varying electric field and

polarization drift. Time varying magnetic field adiabatic invariance of magnetic moment.

3. Plasma fluid equations fluid equations; Conventive, Two fluid and single fluid equations. Fluid drifts perpendicular to B diamagnetic drift.

Diffusion and Resistivity : Collision and diffusion parameters. Decay of a plasma by diffusion, ambipolar diffusion. Diffusion across magnetic field. Collision in fully ionized plasma. Plasma resistivity Diffusion in fully ionized plasmas. Solution of Diffusion equation.

4. Equilibrium and stability : Hydromagnetic equilibriu. Concept of magnetic pressure. Equilibrium of a cylindrical pinch. The Benner pinch. Diffusion of magnetic field into a plasma. Classification instabilities. Two stream instability. The gravitational instability Resistive drift waves.

#### References :

1. F.F. Chen : An Introduction to Plasma Physics (Plenum Press) 1977.

3. W.B. Kunkel : Plasma Physics in Theory and Application (Mc Graw Hill)1966.
4. J.A. Bittencoms : Fundamentals of Plasma Physics (Pergamons Press 1986

#### PHY F02: PLASMA PHYSICS-II

1. Waves in plasma : Electron plasma waves. Ion Waves, Electrostatic electron oscillations perpendicular to B, upper hybride oscillations. Electrostatic ion waves perpendicular to B, ion cyclotron waves, Lower hybride oscillations. Electromagnetic waves in field free plasma. Electromagnetic waves perpendicular to B. Cut offs and resonances, Electromagnetic waves parallel to magnetic field, Hydromagnetic waves. Magnetosonic waves.
2. Kinetic Theory , Boltzmann and Vlasov Equation, Derivation of multifluid equations, Vlasov equation, Linearization of Valsove Maxwell equations. High Frequency plasma waves, Landau damping, A Physical derivation of Landau damping, Low frequency ion acoustic waves, Ion Landau damping.
3. Non-linear effects : Non-linear effects in plasmas. The Sagdeov potential, Derivation of KdV equation for ion acoustic waves. Soliton solution in one dimension. elementary ideas about the pondermotive force adn parametric instability. Oscillating two stream instability, Non-linear Landau damping.
4. Controlled thermonuclear fusion and other plasma applications : Potentials and problems of controlled thermonuclear fusin. Ignition temperature and Lawson criteria. Magnetic confinement. Simple discussion of Tokomak, stellarators, multipoles and Z pinch. Idea about inertial confinement and laser fusion. Methods of plasma heating and problms of fusion. Basic principle and working of MHD power generator, Plasma applications in industry, Plasma torches.

#### References :

4. C. Uberoi : Introduction to Unmagnetized Plasma (Prentice Hall) 1988.

### PHY Z01: LASERS AND LASER APPLICATIONS

Basic Principle and Different Lasers:

Principle and Working of CO<sub>2</sub> laser and Qualitative Description of Longitudinal and TE laser systems. Threshold condition for Oscillation in Semiconductor Laser. Homostructure and Heterostructure p-n junction lasers, Nd-YAG lasers. Principle of Excimer Laser. Principle and Working of Dye Laser. Free Electron Laser.

Non Linear Processes:

Propagation of Electromagnetic Waves in Nonlinear medium, Self Focusing, Phase matching condition, Fiber Lasers, Stimulated Raman Scattering and Raman Lasers, CARS, Saturation and Two photon Absorptions.

Novel Applications of Laser:

Cooling and Trapping of Atoms, Principles of Doppler and Polarization Gradient Cooling, Qualitative Description of Ion Traps, Optical Traps and Magneto-Optical Traps, Evaporative Cooling and Bose Condensation.

Spectroscopic Techniques:

Laser as a source of radiation and its characteristics, Laser fluorescence and absorption spectroscopy, Multiphoton ionization and separation of isotopes.

#### Reference Books:

1. Spectroscopy Volume 1, 2 and 3: B.P. Straughan and S. Walker.
2. Laser Spectroscopy and Instrumentation : W. Demtroder.
3. Principles of Lasers : O. Svelto.
4. Laser Cooling and Trapping : P.N. Ghosh.
5. Frontiers in Atomic, Molecular and Optical Physics : S.P. Sengupta.

### PHY Z02 Reactor Physics - I

Nuclear Reactions and Radiations - Radioactivity, Interaction of Alpha and Beta Particles with Matter, Interaction of Gamma rays with matter, Interaction of neutron with matter, Cross Sections for neutron reactions, Variation of Cross for neutron Reactions, Variation of cross sections with neutron Energy, The Fission Process  
Neutron Transport behaviour-Neutron Transport Concept, Neutron Diffusion theory, Diffusion in multiplying systems, the slowing down of neutrons, slowing down in infinite media

#### Reference :

1. Nuclear Reactor Engineering (Reactor Design and Basics) – Samuel Glasstone & Alexander Sessonske.
2. Introduction to Nuclear Engineering – John R. Lamarsh
3. Fundamentals of Nuclear Reactor Physics – Elmer E. Lewis

4. Neutron Physics – K. H. Becuts, K. Wirtz.

**PHY Z03 Reactor Physics – II**

Nuclear Design Basics – Multigroup Diffusion Theory, Fuel Depletion Calculations, The Neutron transport equation and its approximation  
Reactor Kinetics and Control- Reactor Kinetics, Fission Product Poisoning, Effect of temperature on reactivity, Reactor stability Analysis, General features of Reactor Physics.

**Reference :**

1. Nuclear Reactor Engineering (Reactor Design and Basics) – Samuel Glasstone & Alexander Sessonske.
2. Introduction to Nuclear Engineering – John R. Lamarsh
3. Fundamentals of Nuclear Reactor Physics – Elmer E. Lewis
4. Neutron Physics – K. H. Becuts, K. Wirtz.

**PHY Z04 Health Physics - I**

Radiation sources, Radiation Units, Interaction of radiation with matter, Radiation Dosimetry. Chemical and biological effects of radiation, Methods of Radiation Detection, Statistics, Monte Carlo simulation of Radiation transport

**Reference :**

1. Introduction to Health Physics – Herman Cember, Thomas E. Jonson
2. Atoms, Radiation and Radiation Protection- James E. Turner
3. Introduction to Radiological Physics and Radiation Dosimetry – Frank Herbert Attix
4. Nuclear Reactor Engineering (Reactor Design and Basics) – Samuel Glasstone & Alexander Sessonske.

**PHY Z05 Health Physics - II**

Radiation protection Standards, Radiation shielding Principles, Radiation protection criteria and Exposure limit, External Radiation Protection , Internal Dosimetry and Radiation Protection, Criticality, Evaluation of Radiation safety Measurement, Nonionizing Radiation Safety

**Reference :**

1. Introduction to Health Physics – Herman Cember, Thomas E. Jonson
2. Atoms, Radiation and Radiation Protection- James E. Turner
3. Introduction to Radiological Physics and Radiation Dosimetry – Frank Herbert Attix
4. Nuclear Reactor Engineering (Reactor Design and Basics) – Samuel Glasstone & Alexander Sessonske.

**PHY Z06 Computational Physics – I**

Errors & Uncertainties in Computations, Monte Carlo Methods, Random Numbers, Probability distribution functions, Improved Monte Carlo Integration, Random walks and the Metropolis algorithm, Monte Carlo methods in statistical physics

**Reference :**

1. Computational Physics – M. Jensen
2. Computational Physics – Steven E. koonin
3. A Survey of Computational Physics – Rubin H. Landau, Manuel Jose Paez, C. Bordeianu

**PHY Z07 Computational Physics – II**

Quantum Monte Carlo Methods- Variational Monte carlo for quantum mechanical systems,  
Simulation of molecular systems, Many body systems  
Simulating matter with molecular dynamics, Molecular dynamics, verlet and velocity-verlet  
algorithm, 1-D implementation, Trajectory analysis

**Reference :**

1. Computational Physics – M. Jensen
2. Computational Physics – Steven E. koonin
3. A Survey of Computational Physics – Rubin H. Landau, Manuel Jose Paez, C. Bordeianu

**PHY Z08: LASER-I**

1. Interaction of radiation with matter : Absorption, spontaneous and stimulated emission, Einstein's Coefficients, population inversion, metastable states, gain, absorption coefficient, stimulated cross section, threshold condition. Two level system (Ammonia maser-Physical separation of excited species from those in ground state). Three and Four level system, Rate equations for three and four level system, threshold pump power, relative merits and de-merits of three and four level system.
2. Optical resonators : Resonator configurations, Stability of resonators, Characteristics of Gaussian beam, Transverse and longitudinal modes, mode selection techniques (at least two techniques in each case), losses in a resonator, Hardware design-laser support structure, mirror mounts, optical coating etc.
3. Gas and dye lasers : excitation in gas discharge, collisions of 1st and 2nd kind, electron impact excitation-its cross section, different types of gas lasers : He-Ne, N<sub>2</sub>, CO<sub>2</sub>, Metal vapour lasers, Excimer and chemical laser, dye laser.
4. Laser Parameters and their measurement : Near field and Far field regimes, Internal and external parameters in the near and far field, Detectors and their operational mechanism including specific properties like rise time, spectral response etc.

**Text Books :**

1. *Principles of lasers*, Fourth edition-by Orazio Svelto
2. (Plenum Publishing Corporation, New York, USA ISBN 0-306-454748-2).
3. *Solid state laser engineering*, first and second edition,
4. walter Koechner *Springer series in Optical Sciences*, (Springer-Verlag, New York, USA ISBN).
5. *Principles of Laser and their applications*, Callen, O'shea, Rhodes
6. *Laser parameters*, Heard Reference Books :

7. *Masers*, A. G. Siegman.
8. *Gas lasers*, Garret.
9. *Maser Handbook*, vol. 1-4, F. T. Arecchi, E. O. Schul Dubois, (North Holland).

### PHY Z09: LASER-II

1. Optically pumped laser systems, Optical sources projection geometries, power supply Q-switches-pulse reflection mode, Multiple-pulsing in slow Q-switches. Mode locking. Ruby laser, Nd: YAG laser, Nd:glass, Amplifiers for these lasers, their characteristics, semiconductor lasers, color center laser.
2. Pulse transmission mode Q-switching, Mode locking-active and passive techniques Passive mode locking using dye cell, Distributed Feedback Lasers (and its importance for short pulse generation)
3. Non-linear optics: interaction of radiation with matter, optical susceptibility, propagation of E-M radiation in a medium/non linear medium, S.H. generation, T.H. generation, wave mixing optical parametric oscillation, non linear materials.
4. Laser applications: (i) Holography, (ii) Optical communications/optical fiber (iii) Laser spectroscopy, (iv) Material processing welding cutting etc. (v) Medical applications. (vi) Doppler free two photon absorption, (viii) Isotope separation.

#### *Text Books :*

1. *Laser in Industry*, S.S. Charschan, (Vol Nostrand), 1972.
2. *Solid State Laser Engineering*, Walter Koechner, (Springer-Verlag), 1976.
3. *Applied non-linear optics*, Fzernik and J. Midwinte, (John Wiley), 1973.
4. *Laser Handbook*, Vol.1-4, F.T. Arecchi, E.O. Schul Dobois, (North Holland), 1973.
5. *Application of lasers*, John F. ready.

### PHY Z10:THERMAL PHYSICS-I

1. **Heat Conduction Fundamentals:** The significance of heat conduction; Heat flux; Fourier's law for heat conduction; Heat conduction equation in different orthogonal coordinate systems; Boundary conditions; dimensionless heat conduction parameters; Homogeneous and non-homogeneous heat conduction problems; Conduction heat transfer in solids, fluids and complex materials.
2. **Methods of solution of heat conduction problems:** The use of Green's function in the solution of non-homogeneous, time dependent heat-conduction problems; Application of Laplace transform in the solution of time dependent heat-conduction problems; one dimensional composite medium; generalized orthogonal expansion technique for homogeneous heat conduction problems; Eigen values and Eigen functions.
3. **Approximate Analytical Methods:** The Integral method—basic concepts and applications; The variational Principles: Basic concepts, variational form of one dimensional steady state heat conduction equation; The Ritz method: steady state heat conduction problem for a solid cylinder; The Galerkin method: construction

- of  $\phi_j$  functions, Boundary conditions, steady state heat conduction problem for a rectangular region with heat generation at a constant rate.
4. **Numerical methods for conduction heat transfer:** Finite difference approximation of derivatives through Taylor's series; Finite difference representation of steady state heat and time dependent conduction problems; errors involved in numerical solutions; Accuracy of solutions: Optimum step size; Method of choosing optimum step size; Applications of Finite difference methods to time dependent heat conduction problems.
  5. **Conduction heat transfer in anisotropic medium:** Heat flux for anisotropic solids; Heat conduction equation for anisotropic solids; Boundary conditions; Thermal resistivity coefficients; Transformation of axis and conductivity coefficients; Geometrical interpretation of conductivity coefficients; The symmetry of crystals; One dimensional steady state and time dependent heat conduction in anisotropic solids; Heat conduction in orthotropic medium.

**Reference Books:**

1. Heat conduction by M. N. Ozisik; John Wiley & Sons.
2. Thermal conductivity of solids by J. E. Parrott and A. D. Stuckes; Pion Limited.
3. Introduction to ceramics by Kingery, Bowen and Uhlmann, John Wiley & Sons (Second edn.).
4. Heat transfer in cold climates by Virgil J. Lunardini, Van Nostrand Reinhold Company (VNR).

**PHY Z11:THERMAL PHYSICS-II**

1. **Structures and Thermal properties of Ceramics:** Atomic bonding in solids; Crystal structures; Oxide and Silicate structures; Structure of oxide glasses; Density and thermal expansion of crystals and glasses; Thermal conduction processes; Phonon conductivity of single phase crystalline ceramics; Phonon conductivity of single-phase glasses; Photon conductivity; conductivity of multiphase ceramics
2. **Thermal properties of Complex materials:** A preview of complex materials and their structures; thermal properties of complex materials like polymer composites and metallic/non-metallic foams; Anisotropy effects; Morphology effects; Phase interaction effects; The local and global scale or size effects; Nano-scale size effects and multi-scale modeling; Scale effect in temporal domain; Other complexities and bi-modular behaviors; Structural effects, biometrics and meta-materials
3. **Thermal conduction in nano-fluids:** Fundamentals of nano-fluids; Effect of particle material, particle size and shape; Effect of base fluid and particle volume fraction; Theoretical considerations: Effect of temperature and Brownian motion of nano-particles; Liquid layering around nano-particles; Clustering of nano-particles; Ballistic phonon transport in nano-particles.
4. **Thermal properties of Permafrost:** Distribution of permafrost; origin and existence of permafrost; geophysical processes involved in energy transfer; geophysical conditions affecting permafrost; surface energy balance; thermal

regime of permafrost; steady state and transient relations; ground temperatures; thermal conductivity, specific heat, thermal diffusivity of soils.

5. **Techniques for measurement of thermal properties:** Guarded hot plate method for low thermal conductivity materials, Basic design considerations; Point source, line source and parallel wire methods for the measurement of thermal conductivity of solids, fluids and porous materials. Transient plain heat source for low to high thermal conductivity materials. Errors involved in these methods and their comparative study.

**Reference Books:**

1. Introduction to ceramics by Kingery, Bowen and Uhlmann, John Wiley & Sons (Second edn.).
2. Heat transfer in cold climates by Virgil J. Lunardini, Van Nostrand Reinhold Company (VNR)
3. Thermal conductivity of solids by J. E. Parrott and A. D. Stuckes; Pion Limited.
